

Finals Task 2. Navigating Power BI

Description:

This activity focused on gaining comprehensive proficiency in the entire Power BI workflow, encompassing data preparation, modeling, analysis, and visualization techniques using the flights_data and airports datasets. The process began with data cleaning, where efforts were made to correct inconsistent column names, address missing values, and remove irrelevant or redundant columns to ensure data quality.

Afterward, the cleaned data was organized into fact and dimension tables to establish a star schema, promoting efficient data retrieval and analysis. Using Data Analysis Expressions (DAX), calculated columns and measures were created to evaluate various flight performance metrics, including total flights, cancellations, delays, and on-time arrivals. These measures were strategically grouped to improve clarity and usability. The visualization phase involved designing interactive dashboards and charts that effectively conveyed key insights, enabling stakeholders to understand trends and patterns in flight data.

This exercise enhanced skills in data modeling, DAX calculations, and report creation within Power BI, providing a solid foundation for developing dynamic, insightful business intelligence reports. Overall, it was a comprehensive practical experience that strengthened the ability to manage and analyze complex datasets through Power BI's powerful tools.
