

Finals Lab Task 4. Designing Interactive Reports in Power BI

Description:

This project entailed developing a comprehensive three-page Power BI report designed to effectively display sales and performance data. The process involved creating various visualizations such as charts and graphs, along with incorporating slicers and filters to enable dynamic data analysis. Emphasis was placed on arranging the layout thoughtfully, customizing visuals to enhance clarity, and synchronizing slicers across pages to improve user experience.

Additionally, careful formatting was applied to ensure the report was visually appealing and easy to interpret. The final report was prepared for publishing, which helped to strengthen skills in dashboard design, data visualization techniques, and creating interactive reports that facilitate insightful data exploration and decision-making.
